

## Who We Are

### dtm group – The IT Manufactory

We see ourselves as the high-tech manufactory in the field of information technology. Our strength is the combination of perfect craftsmanship and state-of-the-art technology. We invest in research & development to create technological trends in the domain of data centers and IT cabling at our site in Meckenbeuren, Germany.

The variety of core competencies available in our company group enables us to implement complete IT systems for organizations and assist our customers as a one-stop supplier from initial planning to after-sales service.

With this objective in mind, we employ highly qualified personnel, e.g. engineers, architects, software developers, project managers, technical specialists, site managers, fitters and trainees in technical, commercial and design-related job profiles.

## How to Contact Us

You can contact us most easily by e-mail or telephone. We will also be glad to welcome you on our premises for a previously agreed visit.

**Coming soon!**  
Your new datacenter  
monitoring, control & AI tool.

## Vaiking is the New Intelligence for all Data Centers and Server Rooms.

**Vaiking** is structured according to 3 building blocks. First, we create total transparency by closely knit **monitoring**. Second, we relieve the IT staff from high loads by **DC automation**. Third, we increase the energy efficiency of the data center by **artificial intelligence**.

**Vaiking** is an excellent solution for all large-scale data centers, co-locations and hyperscalers who need to monitor extremely many data points instantly and efficiently. Another strength of the system are distributed infrastructures, such as edge data centers, which can be controlled and monitored automatically and thereby facilitate remote handling tremendously.

**Vaiking** is able to monitor and control everything that is integrated into your network and speaks IP. It can automate everything that can be switched or controlled. This means that we also monitor bus systems or building control systems in addition to the servers.

**Vaiking** will be able to comprehend your data center after a certain learning phase and will help you to improve the up time of IT services and save important resources, such as energy.

For this reason we recommend: Never run a datacenter without your **Vaiking**!

# Visible AI is King
